SUMMARY

Software engineer building production-grade AI/LLM systems for internal engineering workflows: an agentic incident-response platform (Slack + GitHub integrated, pgvector RAG, LLM reranking, MCP tool calling), a human-in-the-loop coding agent on the Claude Agent SDK, and workflow automation guided by a calibrated scoring model — on top of deep backend fundamentals (event-driven pipelines, ClickHouse analytics, distributed-system consistency). Solo-delivered company-wide platforms running in production at scale;

EXPERIENCE

URBANPIPER TECHNOLOGIES PVT LTD, BENGALURU, INDIA

July 2024 – Present

Software Engineer II

Oct 2025 – Present

- Designed and built, solo, a company-wide AI incident-response system for internal engineering workflows: structured Slack incident intake with automatic routing, Git Hub integration tying each incident to its fix, and a RAG pipeline (pgvector embeddings, LLM reranking, log retrieval via a Kibana MCP server) that surfaces similar past incidents and their fixes to cut time-to-resolution.
- Built a coding agent on the Claude Agent SDK that triages critical Sentry alerts, localizes the fault in the codebase, and opens a reviewable PR with a candidate fix — a human-in-the-loop workflow where nothing deploys without engineer review.
- Automated aggregator dispute recovery end to end: reverse-engineered delivery-platform portal auth/attestation, built a browser+API automation service (Playwright) to file disputes, and a calibrated win-probability model to prioritize which disputes to file under monthly quota limits — replacing a fully manual ops workflow.
- Automated store remediation with an “Always-On” recovery layer (anti-flap delay/cooldown, audited state machine) that re-enables downed stores; saved \$2,750 for a single merchant in a 3-week pilot (157 recoveries).
- Built store uptime/downtime analytics from scratch on ClickHouse — AggregatingMergeTree materialized views pre-aggregating high-volume events into fast queryable metrics — plus the real-time availability layer over a Menu Analyzer processing 1.5M items / 30 min, with hierarchical schedule evaluation and multi-aggregator correctness fixes.
- Built a cross-service sync over Kafka event streaming for real-time multi-service consistency, replacing brittle point-to-point updates; debugged stuck Kafka consumers and ETL pods on Kubernetes.

Software Engineer I

July 2024 – Oct 2025

- Built a merchant onboarding service that cut average go-live time from 17 days to 4 and onboarded 260 clients — using Hasura to auto-expose a GraphQL layer over Postgres, eliminating hand-written CRUD APIs.
- Architected the alerting system from scratch (event gathering, roll-up, and firing) so merchants get real-time, de-duplicated notifications of store/item issues and can act immediately.
- Led the Python 3.6 to 3.9 upgrade of a large legacy service — resolving dependency, syntax, and library-compatibility breakage across the codebase as an early major responsibility.
- Triageed dozens of SEV-1/SEV-2 production incidents on the on-call rotation across reporting, analytics, and reconciliation pipelines for enterprise brands in India, the UK, and MENA — including diagnosing silent ingestion data loss and running safe backfills on high-volume pipelines.
- Delivered Atlas (React) features end to end — a global command palette (PIP) with fuzzy search, recently 1,150 opens and 500 in-product navigations — plus backing menu-platform APIs (access control, MENA Menu V2, Lightspeed POS OAuth).

SKILLS

AI/LLM: Agents & tool calling (Claude Agent SDK, Claude Code) • RAG (pgvector, embeddings, LLM reranking) • MCP (built servers & clients) • prompt engineering • evaluation & calibrated scoring

Languages: Python • JavaScript • SQL (proficient) | Shell • HTML • CSS (familiar)

Frameworks/Libraries: FastAPI • React • Playwright • Hasura (GraphQL) • Django

Databases: ClickHouse • PostgreSQL/pgvector • MongoDB • Elasticsearch • Redis • MySQL

Tools/Platforms: Kubernetes • Docker • Kafka • GitHub & Slack APIs • Grafana • Kibana/ELK • Sentry • PostHog

PROJECTS

COGNIFY

AI-based interview platform

RAG platform generating adaptive, conversational assessments from uploaded documents (SOPs / guidelines), with real-time LLM evaluation of candidate answers. cognify.singhpratap.dev

MARUDHAR RESORTS

Live – website + property management system

Built a website and custom Property Management System (PMS) for a working resort, in active production use. marudharresorts.com

EDUCATION

VTU – BACHELOR OF ENGINEERING, COMPUTER SCIENCE

2020 – 2024

ACHIEVEMENTS

Amazon Gen AI Hackathon – Winner. Engineered an MCP-backed command palette (PIP) featuring global fuzzy search, keyboard navigation, and analytics tracking.
